

EOD TOOLS DX10-U DUAL INITIATOR

The DX10U is a safety initiator used for explosive firing, particularly in forced-entry procedures

The Dual Initiator directly fits threaded NONEL Line or uses the breach block for custom length applications using standard shotgun primers. These lightweight initiators are coated with a hard anodize finish, that won't wear down during repetitive firing. The casing is made of nonmagnetic and nonsparking aircraft strength aluminum.

There are two safety systems to prevent unintentional firing of the initiator and the revised design accommodates both short and long styles of pre-terminated NONEL® line.

DX10-U DUAL INITIATOR

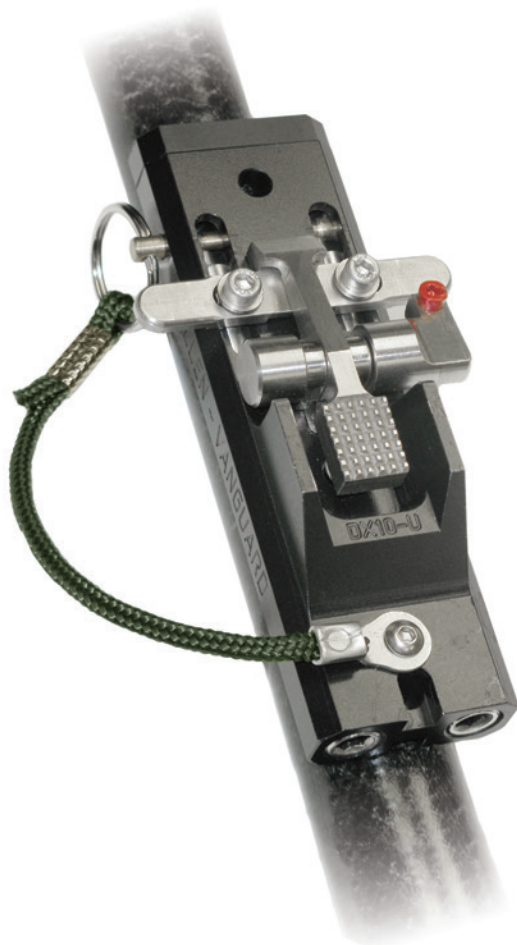

EOD
TOOLS

The DX10-U Dual Initiator is a safety initiator used for explosive firing, particularly in forced-entry procedures.

- The DX10-U fits different styles of pre-terminated NONEL line; this is achieved through the use of a removable body extension plate
- The DX10-U has been subjected to extensive environmental testing, including salt fog, sand and dust, drop, function and wear

Key Features

- There are two active safety systems to prevent unintentional firing of the initiator: a tactile colour-coded safety knob and a safety pin
- The tactile safety knob is colour-coded red for fire, when the initiator can be fired; when rotated 180 degrees the safety knob displays a green 'S' for safe, when the trigger cannot be fired

The DX10-U contains an integrated pole mounting feature

- The safety pin prevents accidental firing of the Initiator through obstructing the firing pins, the dual sear has to be drawn back to disengage the safety pin
- The DX10-U contains a trigger guard as an additional passive safety feature
- The DX10-U contains an integrated pole mounting feature
- If one of the DX10-U's firing pins is blocked and obstructed from firing fully home, this will not prevent the other one from doing so
- The DX10-U directly fits threaded NONEL line or uses the breach block for custom length applications using standard shotgun primers
